

RxNova Processing Options Domain – Certification

April 24, 2015

Processing Options – Admin

Hierarchy

- MCS -> BCS -> Customer -> Client -> Group
- Options set at highest level will be inherited by levels below unless it is overridden.
- Default values are housed at the Master Customer Set level.
- Option Values are retrieved starting with the values at the lowest level (Group) and moving upward until a value is found.

Admin Tool

- RxNova Business owns the setup of Processing Options

Developing Programs to Use Processing Options

- The programs must use the system names assigned the Admin tool inside the programs.
 - S08.PRODUCT_OFFERING_SHORT_NM
 - S09.SERVICE_OFFERING_SHORT_NM
 - S10.PROCESS_OPT_SYSTEM_FIELD_NM
- Programs must first call MISQSR19 with the S08.PRODUCT_OFFERING_SHORT_NM to determine if the Master Customer Set has been “turned on” for that product
 - “Turned on” means the date in question (usually Fill Date) is within the Effective Date range assigned to the MCS for that product
 - The reason to user MISQSR19 first is because of performance in POS, it performs an existence check prior to executing the more expensive SQL to retrieve the option values
- If MISQSR19 determines that the MCS has been turned on for this product MISQSR21 and MISQSR22 can be used to retrieve the Option Values.
 - MISQSR21 retrieves a value for a Cust/Client/Group for a single S10.PROCESS_OPT_SYSTEM_FIELD_NM
 - MISQSR22 retrives a set of option values for a Product or Service using the system names
 - A good example would be inside MISQAM01 for PRACCUM.
 - 1105- calls SR19 to validate the PRACCUM is turned on
 - 1110- calls SR22 to retrieve all the option values
 - 1115- spins through the response from SR22 to pull the options for use in the programming

Processing Options – Assign Values

Creating an effective date range

- ****Always use the Application to update Effective dates****
- Use of SPUFI or FMDB2 (D.FM) will cause unpredictable results
- Dates are validated against the start and end date of the entity (i.e. Customer Set up Start and End date).
- The date ranges below Master Customer Set must all be within the effective date of the MCS.
- Gaps can be present.

The screenshot displays the ARGUS ADST Company web application. The top navigation bar includes links for Auth, Claim, Customer Setup, Plan Setup, Lists, History, Provider, Pharmacy, Drug, Security, TDG, and Help. Below this, a welcome message for Kris Lawson is shown, along with a 'Jump to:' field and a 'Go' button. The main content area is titled 'Hierarchy level: Master Customer Set' and includes fields for 'Number: 27', 'Name: PerformRx', 'Financial start date:', and 'End date:'. A tabbed interface shows 'Header', 'Details', 'Notes', and 'Summary' tabs. The 'Details' tab is active, showing 'Tracking Information' with fields for 'Tracking ID: *', 'Reason:', and 'Notes:'. Below this is the 'Products' section, which includes a 'Claims Processing' tab and a 'Product Effective Date Range' dialog box. The dialog box has fields for 'Selection:' (Add New Date Range), 'Existing date range:', 'Copy from date range:', 'Start date:' (01/01/2013), and 'End date:'. 'Insert' and 'Cancel' buttons are at the bottom right of the dialog.

Summary Tab

- The summary tab will show the values that will be used based on the hierarchy
- Below shows a client with only two overrides in Claims Processing/Transaction Processing beginning 1/1/2014. The summary tab can be used to see what options will be used on a given date looking up through the hierarchy.

The screenshot displays a software interface with a left-hand navigation menu and a main content area. The navigation menu includes 'Pricing', 'Claims Processing' (highlighted with an orange arrow), '01/01/2014 - No end date', 'Pharmacy', 'Service Fees', 'Financial', and 'Prescriber'. The main content area is titled 'Transaction Processing' and contains a list of settings. Most settings are blank, but 'Alternate Business Flag' is set to 'N - Normal Claims' and 'Fill Receive Interval' is set to '999'. A blue bar at the bottom of the main content area contains the text 'Transaction Processing'.

Claims Processing Integration

- The scope of Project #749 was to take Customer (H87) and Client (G83) parameters and convert them into the Processing Options application. Those are now held within the “Claims Processing” product, or PRCLAIM.
- MISQSR22 was developed to retrieve these options and populate the copybooks used in POS that house the legacy parameter values. The goal was to retrieve the value one time and feed it into all areas used in POS.
- If an effective date is placed on the MCS a claim within that date range will blank out the legacy parameter values and only use what is found in RxNova Processing Options.
- The goals of #749 were to reduce duplication of parameters across Customer and Clients and, reduce web development needs by dynamically building the front-end.

Architecture Tuning

- The SQL used to traverse the hierarchy is expensive.
- A linear table approach was implemented for certain products where tuning was necessary for response time.
 - Claims Processing (PRCLAIM)
 - Accumulator (PRACCUM)
 - Authorization (PRAUTH)
 - Pricing (Pricing)
 - Pharmacy (Pharmacy)
 - Service Fee (ServiceFee)
 - Member File processing (Mem File)
- The BX3 table was created to improve performance.
- Project teams adding options to any of these products will need to also add columns to the BX3 and update the following modules
 - IPPO0002
 - IPPO0003
 - SPS14001
 - MISQSR26
 - MISQSR27
- This approach captures the option values for Customer and Client levels for 2 days (current and the next day) in a single row, optimizing the SQL response time.
- A nightly job ensures the values are updated for the next day.
- The BX3 is kept in sync real-time using the stored procedure. Anytime the Assign Values application updates the S14 the BX3 is kept in sync.
- The project team will still call MISQSR21 or MISQSR22 and discussed earlier. Those module will know the proper times to use the BX3.
- ****Always use the Application to update Effective dates****
- Use of SPUFI or FMDB2 (D.FM) will cause unpredictable results
